My name is UMURERWA Shenge Appoline.

App name	USAPortfolio (initials U-S-A + Portfolio)
Student	UMURERWA Shenge Appoline
Registration number	25/27116
Verification code	MOB-A2-7116
Course	Mobile Application Development (SWE 3409), INES-Ruhengeri
Android package	rw.ac.ines.ug2527116.usaportfolio
Technology	React Native, Expo, TypeScript, React Navigation, AsyncStorage, Expo ImagePicker

Concept and purpose

USAPortfolio replaces a paper CV with a small Android application. A recruiter installs the APK, opens it without Expo Go and understands who I am within two minutes, even without an internet connection. It shows my identity, skills, education, projects and an editable profile that is saved on the phone.

Intended recruiter

A recruiter or lecturer at an internship, innovation challenge or first job interview. They are often in a hurry, may be holding the phone with one hand, and may have no data connection, so the key facts must be visible on the first screen and in few taps.

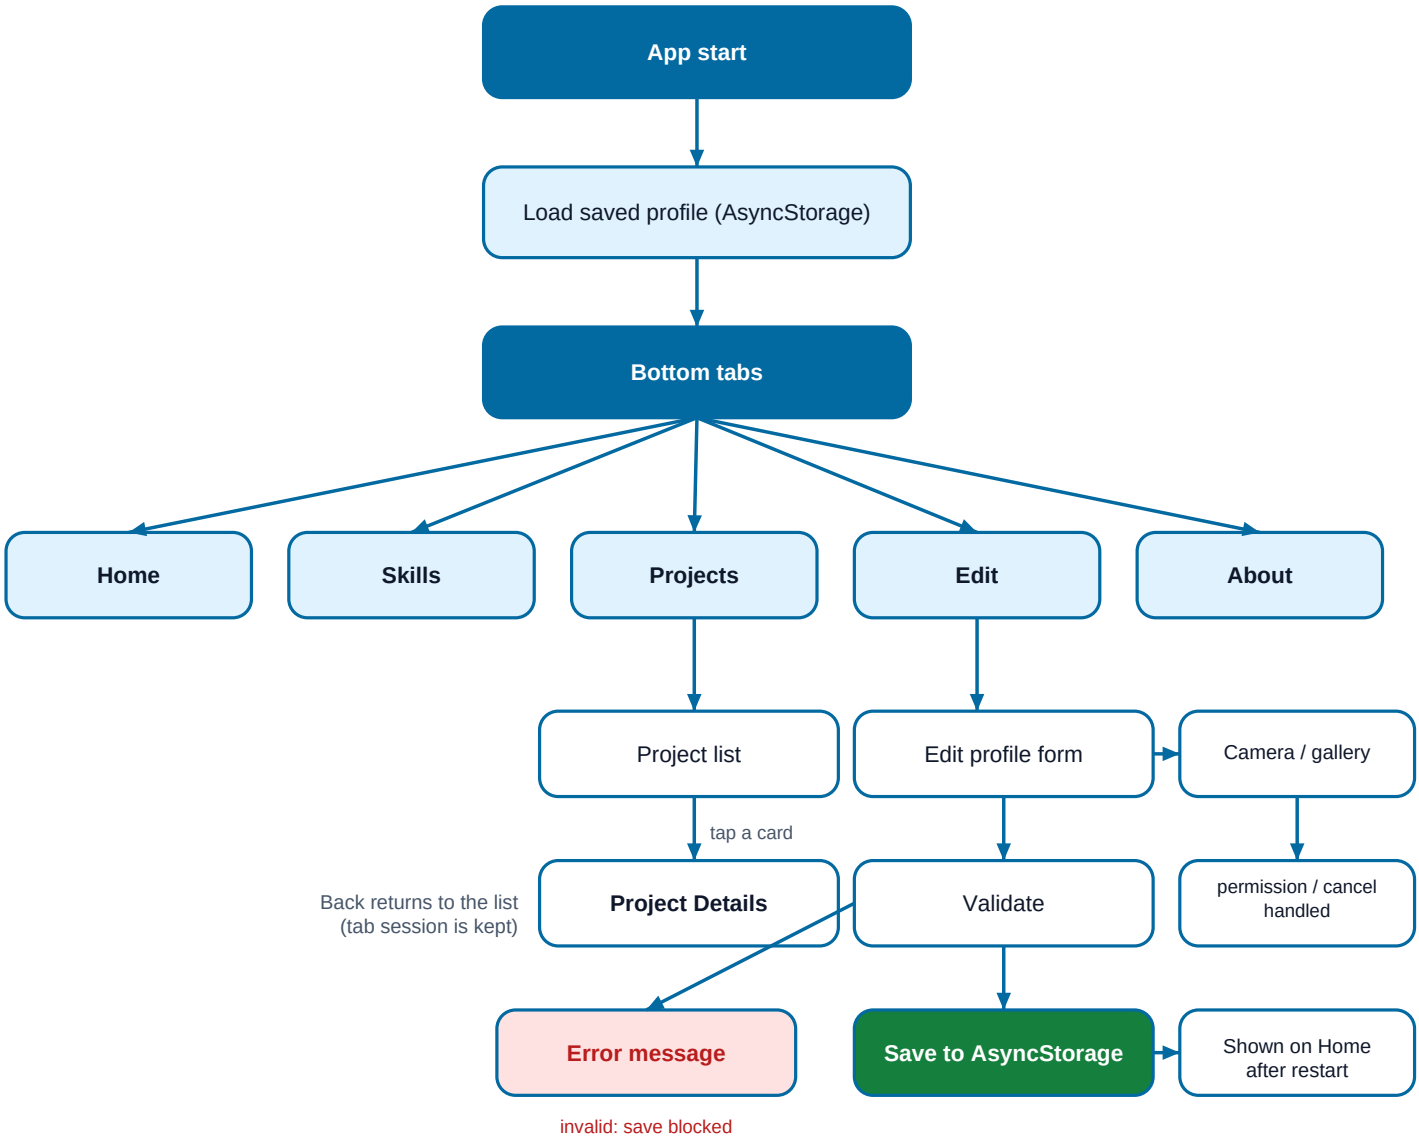
Visual direction

A calm, clean sky-blue theme. Pale blue backgrounds keep the screen light, white cards group information, and dark blue is used for headings, buttons and the active tab. Large rounded cards and a circular profile photo give a friendly but professional look. The same colors and spacing are reused on every screen through a single theme file.

Primary dark	Headings	Accent	Chips	Background	Errors	Success
#0369A1	#075985	#38BDF8	#E0F2FE	#F0F9FF	#B91C1C	#15803D

2. User flow and information architecture

The app has five bottom tabs. Only the Projects tab contains a stack (list -> details). The profile is held in one shared state (context) that is loaded from AsyncStorage when the app starts.



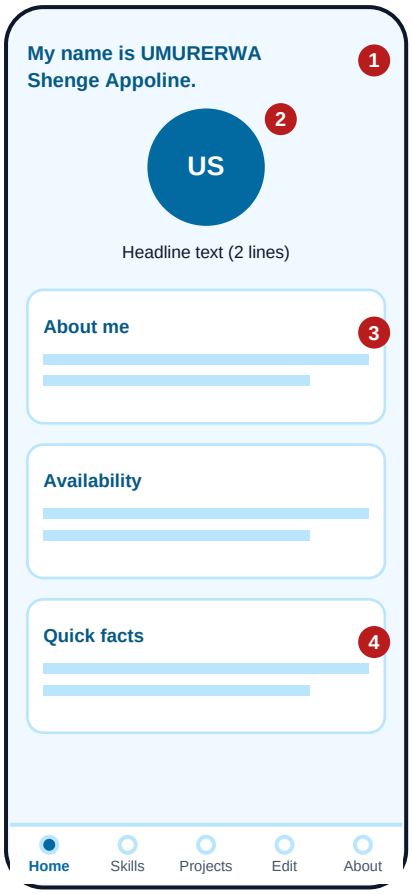
Information architecture

Home: name sentence, photo, headline, biography, availability, quick facts. **Skills:** five skills and an education timeline. **Projects:** list and a separate detail screen with problem, my contribution and technologies. **Edit:** photo actions and four controlled fields. **About:** app, student and release information and the data-use statement.

Saved-state flow: Save writes the profile to AsyncStorage, then updates the shared state, so Home changes at once. On the next launch the saved profile is read before the screens are shown. **Reset profile** deletes the stored profile and restores the default one. All five tabs work offline.

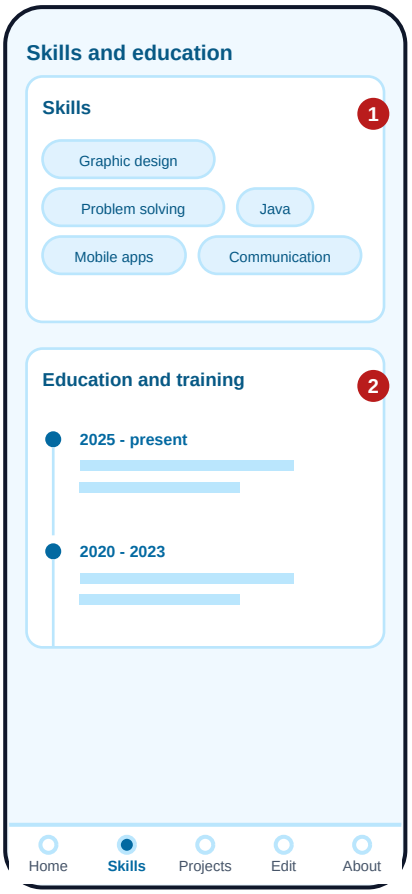
3. Annotated wireframes (1 of 2)

Home



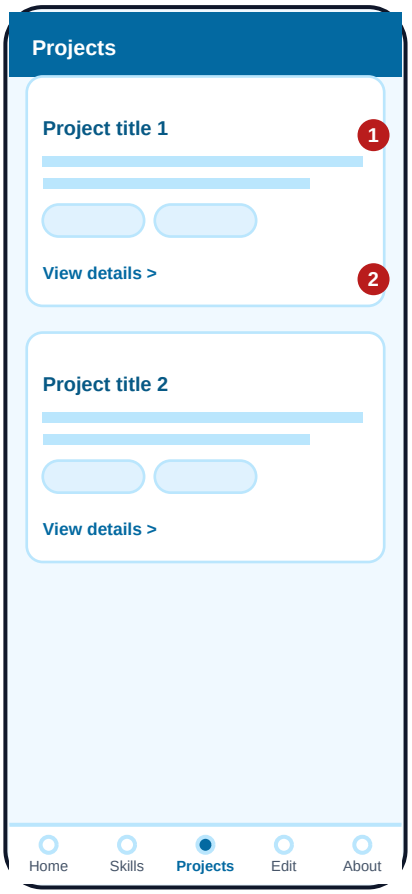
1. First sentence is exactly "My name is [full name]."
2. Photo or initials avatar if no photo.
3. Cards group biography and availability.
4. Quick facts: primary skill and code MOB-A2-7116.

Skills and education



1. Five skills as reusable chips (SkillChip).
2. Education timeline built from TimelineItem components. Empty state text if no entries.

Projects

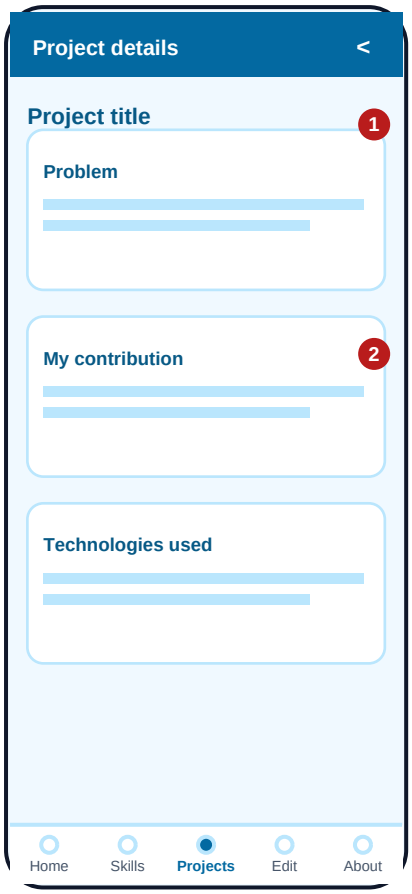


1. ProjectCard: title, problem, technologies.
2. Tapping a card opens Project Details with projectId.

Responsive behaviour: every screen is a vertical ScrollView with Flexbox cards, so it works on a narrow phone and keeps all content reachable when the system text size is increased. Chips wrap to the next line instead of overflowing.

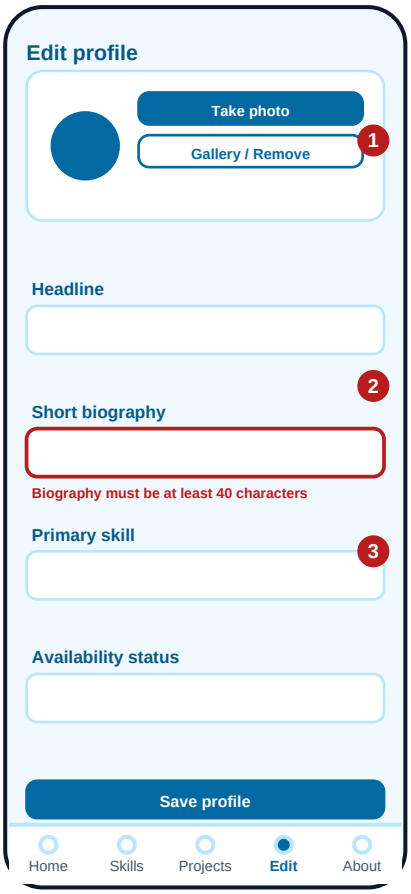
4. Annotated wireframes (2 of 2) and states

Project Details



1. Stack route; Android Back returns to the list.
2. Parameter projectId finds the project. If not found, a "project could not be found" message is shown.

Profile editor



1. Take photo, replace from gallery, remove; permission and cancel messages.
2. Field-level error under the field; red border; save blocked.
3. Primary skill chips (radio) from the skills list.

Required states

Error state

Not saved. Please fix the highlighted fields. Each invalid field shows its own message and red border.

Success state

"Profile saved on this device." The new text appears on Home and is still there after restarting the app.

Empty and permission states

No photo: initials avatar. Camera denied: message and Open Settings button, gallery still works. Gallery cancelled: "No photo was selected, current photo kept." No projects: "No projects added yet."

Validation rules (src/utils/validation.ts)

1) Headline required, 10 to 120 characters. 2) Biography required, 40 to 400 characters. 3) Primary skill required and must be one of the listed skills. 4) Availability required, 10 to 160 characters. 5) Headline and biography must contain letters. Messages are shown after the field is touched or after pressing Save, and an invalid form is never saved.

5. Visual and accessibility decisions

Color and contrast

Contrast ratios were calculated with the WCAG formula. All pairs are above the 4.5:1 minimum for normal text.

Sample text	Body text on white	17.9 : 1
Sample text	Headings on pale background	7.1 : 1
Sample text	Button text on primary	5.9 : 1
Sample text	Muted text on white	7.6 : 1
Sample text	Error text on white	6.5 : 1
Sample text	Success text on light green	4.6 : 1

Typography. The system sans-serif font is used so text renders well on every Android phone. Sizes: screen headings 24-26, card titles 18, body 15-16, hints 13. Body text is never below 13.

Spacing and touch targets. A spacing scale (4, 8, 12, 16, 24) is shared through theme.ts. Buttons are at least 48 px high and skill chips at least 40 px, so they are easy to tap with one hand.

Accessible labels. Buttons, chips, project cards, photos and form fields have accessibilityLabel, role and hint (for example "Profile photo of ...", "Project: ..., opens the project details"). Headings use the header role. Error and status messages use a polite live region so TalkBack announces them.

Large-text behaviour. No fixed heights are used for text. Cards grow with their content, every screen scrolls, chips wrap onto new lines, and the tab labels are short. This was tested with the phone font size set to large.

Color is not the only signal. Errors have a message and a red border; the selected skill chip changes fill and has the selected state; the active tab has a filled icon and a bold label.

Offline and privacy. No feature needs a connection. Only the editable profile and the local photo path are stored on the device; no passwords or tokens.
